
Moodoor Studio × Everfracted

A SHARED-DATA, SEPARATE-EXPERIENCE MERGER

One source of truth. Two purposeful experiences.

Evercrafted

Remains the definitive maker-facing system for design, inventory management, marketplace publishing, and quality review.

Moodoor

Becomes the customer-facing editorial finder: a gentle, curated three-step route to the right available wreath.

The merger brings Moodoor's public-publishing and explainable-matching principles into Evercrafted, rather than operating a parallel, disconnected application.

Adapt the durable logic — not the duplicate runtime.

The uploaded archive contained a full React/Vite/Express workspace with a Wouter router and browser-local repositories. We extracted principles, not platforms.

Adapted

- Public customer flow and presentation principles.
- Explicit publishing boundary for makers.
- Deterministic, explainable memory matching.

Excluded

- Standalone Wouter shell (Everfracted already handles routing).
- Local state repositories (divergent from Firestore).
- Unreviewed third-party dependencies.

Deferred

- Collection, campaign, launch, and lookbook modules.
- To be integrated once authoritative Everfracted schemas and maker workflows mature.

The merger adds two routes, not a second platform.

Consumer

`/moodoor`

Remains the public editorial landing page; calls to action now lead directly into the finder.

`/moodoor/find`

A public three-step flow: Feeling → Season → Door → Curated edit.

Maker

`/app/moodoor-studio`

A Studio-tier maker workspace to review, release, or remove eligible marketplace designs.

BUILT ON EVERFRACTED'S EXISTING REACT ROUTER, FIREBASE, AUTHENTICATION, AND TIER GUARD

Publication is an explicit quality gate.

- A consumer listing must have a marketplace status of **published**.
- It must be available and either explicitly approved or meet the **0.78** quality threshold.

- It must be explicitly released: `moodoorPublished = true` or `moodoorStatus = 'published'`.
- A maker may see eligible candidates in Studio before releasing them; consumers cannot.

The public projection stays intentionally small.

Moodoor can use

- ✓ Title, summary, approved image, and price
- ✓ Availability label (e.g., "In stock", "Limited")
- ✓ Public mood, season, palette, and formula tags
- ✓ Short, customer-safe match explanation

Moodoor never receives

- ✗ Internal notes, supplier data, costs, and margins
- ✗ Raw inventory quantities
- ✗ Placement coordinates, collision data, and production detail
- ✗ Internal score components and confidence values

Matching is deterministic, explainable, and binary by signal family.

Hard eligibility

- Consumer catalog query begins with status = published.
- Reject unless Moodoor release is explicit.
- Reject unavailable, sold-out, discontinued, or below-quality records.

Scoring formula

$$\text{score} = 0.22 + 0.34 \cdot M + 0.22 \cdot S + 0.16 \cdot D + A$$

Start score: **0.22**; retain only matches at **≥ 0.42**; cap at **1.00**.
Each signal is a one-time binary increment.

SYMBOL	CONDITION	WEIGHT
M	Any selected-mood token appears in public listing text	0.34
S	Selected season appears in season tags or public text	0.22
D	Any door-context token appears in public listing text	0.16
A	In stock / limited availability	+0.06 / +0.03

MAXIMUM 1.00 COMPOSITION

A warm winter wreath on dark wood scores 1.00.

STEP	EVIDENCE	SCORE CHANGE	RUNNING SCORE
Baseline	Eligible candidate	+0.22	0.22
Mood	"warm" / "hearth" appears in title, summary, tags, palette, or formula	+0.34	0.56
Season	"winter" appears in season tags or public listing text	+0.22	0.78
Door	"warm", "golden", "ivory", "contrast", or "evergreen" appears	+0.16	0.94
Availability	In stock	+0.06	1.00

Ranking Rules

- Examples are ranked by score descending; **title breaks exact-score ties.**
- **Formula duplicates are removed;** title is the fallback identity when no formula exists.
- Moodoor returns no more than **three distinct results.**

The customer receives a clear reason — not a black box.

- The matcher searches normalized text across **title, summary, formula, season tags, mood tags, and palette tags**.
- A category match is binary: multiple matching words do not multiply the same category weight.
- The explanation surfaces up to the first three positive signals: for example, *“warm mood, winter fit, dark wood compatibility.”*
- If no result clears **0.42**, Moodoor intentionally shows a no-match state rather than force a weak recommendation.

MINIMUM SCORE THRESHOLD: 0.42

Implementation connects product, operations, and reliability.

- `pages/Moodoor.tsx` provides the public finder and maker publishing Studio.
- `services/moodoorMatching.ts` provides the public projection, eligibility gates, ranker, vocabulary, and publication toggle.
- `services/geminiClient.ts` makes optional AI initialization lazy so missing browser keys cannot block Moodoor.
- Existing source-path, Firebase import, and app alias defects were corrected so the front end builds reliably.

The merge is validated; the launch boundary is explicit.

Completed validation

- ✓ Archive catalogued without executing archive code.
- ✓ Deterministic matcher fixtures passed.
- ✓ Vite production build passed.
- ✓ Browser verification confirmed finder rendering, mood selection, and progression to Season.

Next production hardening

- Serve a dedicated public Moodoor projection through Firestore rules or a server-side/callable function.
- Require public mood, season, palette, availability, and quality-approval fields at marketplace publication.
- Add public detail pages, approved story drops, publishing history, and route-level code splitting.

Moodoor makes selection feel
considered.

Private craft. Public clarity.
